

OND Wireless Integration Services

Sometimes the best wireless solution is tailored to fit your business. At OverNet Data plc we recognise this and offer specialist wireless system integration services to help you get the most out of mobile data.

As experts in mobile data services, OverNet Data has a highly experienced, dedicated team. From bespoke application development to integrating the wireless channel into existing legacy systems – you can rely on our wireless expertise.

The team Our analysts, designers and developers encompass the full range of skills necessary to build robust, reliable and secure business applications. Our background is in operational system development across industry sectors with broad capability in enterprise integration and middleware software packages. Complementing this is an in-depth strength in Web, WML, XML, Java, C++, PocketPC and EPOC.

The same team has developed BALI™, our unique mobile application software specifically designed for PDAs and smartphones connecting over GPRS. Our skills and the use of BALI™ in your wireless projects will deliver the richest applications in the shortest timescales.

Our services With extensive experience of application technologies such as Wireless Application Protocol (WAP), security and mobile booking, as well as next generation bearer technologies, such as General Packet Radio Services (GPRS), we know how to create the solution you need. We offer:

- System and service specification
- System integration, test and deployment
- Wireless infrastructure design
- Support and application maintenance
- Application design and development

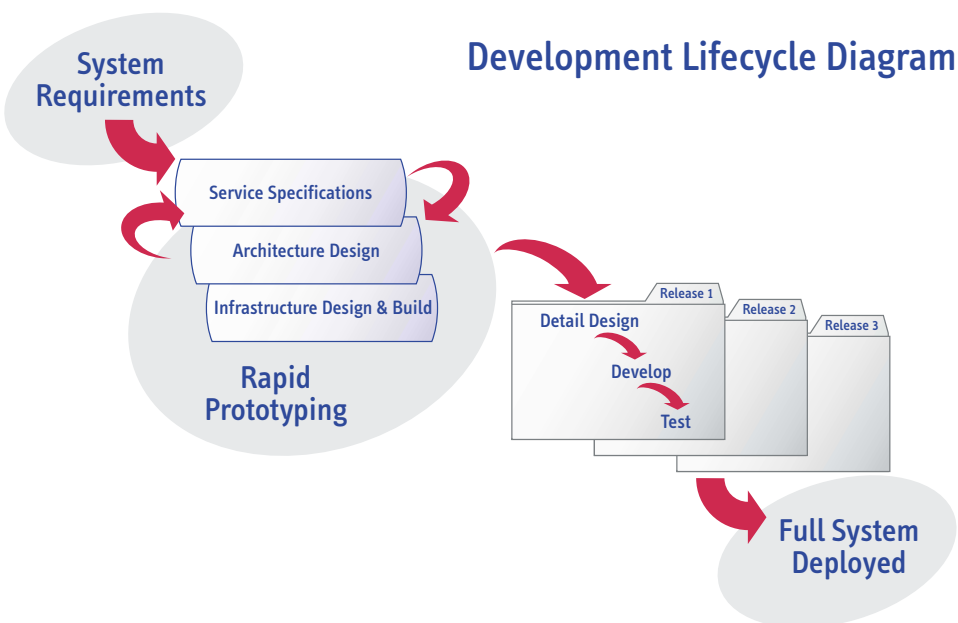

Wireless infrastructure – a speciality For ASPs, ISPs and network operators we offer a specialised service in the design and deployment of the infrastructure necessary to provide wireless services for business customers. Our designers will specify the hosting needs and architect the system based on OverNet Data's 'WASP Management System' software, to provide functions such as:

- Advanced access control and user authentication
- Easy to use web-based system administration
- Data usage logging 'per click'
- Remote control and monitoring
- Billing interface
- Wireless protocol detection

OND Wireless Integration Services

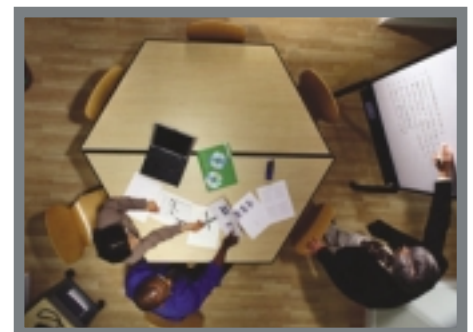

As a professional services provider, OverNet Data undertakes all its assignments using a proven lifecycle methodology. The company's approach is based on the Dynamic Systems Development Method and relies heavily on early visualisation of the wireless service. For this visualisation, prototypes are created rapidly and evaluated live, over-the-air using our development hosting facilities. We then use an incremental delivery methodology which enables us to use a timeboxed approach for each service release – this ensures your priorities are met and the service provides commercial returns in the minimum time.

We work with you. OverNet Data's philosophy is to build robust, reliable and secure business applications whilst working as closely as possible with our clients, as we believe success comes from fully understanding our customers needs. Our team stands ready to work alongside your project team, alternatively we can undertake work off-site using our own dedicated development and testing facilities. Either way you can be assured of a professionally managed service.

OverNet Data is the premier provider of real-time, interactive mobile data solutions for the business market, offering unrivalled expertise for GPRS and beyond.
